g9 G9. Globalisation: overall

Variable type = numeric, width = 2

G.9. Here's how some people define globalisation. Globalisation refers to the increasing connections between countries that have come with the growth of international travel and increases in communications, such as the internet. This has led to an increase in world trade and the flow of investments between countries. It has also made it more likely that conditions in one country will affect conditions in other countries and has led to a more international culture in such areas as music, movies and fashion.

Please indicate how positive or negative you think this process of globalisation is overall, using a scale from 0 to 10, with 0 being completely negative, 10 being completely positive and 5 being equally positive and negative:
